Cryptography

## Graph Ramsey Numbers

Example
$R\left(C_{5}, K_{4}\right)=13$

- There exists a 2-coloring of $K_{12}$ with no red $C_{5}$ and no blue $K_{4}$.
- Every 2-coloring of $K_{13}$ has a red $C_{5}$ or a blue $K_{4}$.

## Graph Ramsey Numbers

## Example

$R\left(C_{5}, K_{4}\right)=13$

- There exists a 2-coloring of $K_{12}$ with no red $C_{5}$ and no blue $K_{4}$. 0

## Graph Ramsey Numbers

## Example

$$
R\left(C_{5}, K_{4}\right)=13
$$

- There exists a 2 -coloring of $K_{12}$ with no red $C_{5}$ and no blue $K_{4}$.
- Every 2-coloring of $K_{13}$ has a red $C_{5}$ or a blue $K_{4}$.

## Example

'Proof' that $R\left(C_{5}, K_{4}\right)=13$

- 2 red edges to one part $\Rightarrow$ red $C_{5}$
- 

## Example

'Proof' that $R\left(C_{5}, K_{4}\right)=13$

- 2 red edges to one part $\Rightarrow$ red $C_{5}$
- blue edge to each part $\Rightarrow$ blue $K_{4}$

## Example

'Proof' that $R\left(C_{5}, K_{4}\right)=13$

- 2 red edges to one part $\Rightarrow$ red $C_{5}$
- blue edge to each part $\Rightarrow$ blue $K_{4}$

Can color 9 edges but 10th forces red $C_{5}$ or $K_{4}$

## Example

'Proof' that $R\left(C_{5}, K_{4}\right)=13$

- 2 red edges to one part $\Rightarrow$ red $C_{5}$
- blue edge to each part $\Rightarrow$ blue $K_{4}$

Can color 9 edges but 10th forces red $C_{5}$ or $K_{4}$ NOT a proof

## Example

'Proof' that $R\left(C_{5}, K_{4}\right)=13$

- 2 red edges to one part $\Rightarrow$ red $C_{5}$
- blue edge to each part $\Rightarrow$ blue $K_{4}$

Can color 9 edges but 10th forces red $C_{5}$ or $K_{4}$ NOT a proof
Would be a proof if this is only good coloring of $K_{12}$

## Example

'Proof' that $R\left(C_{5}, K_{4}\right)=13$

- 2 red edges to one part $\Rightarrow$ red $C_{5}$
- blue edge to each part $\Rightarrow$ blue $K_{4}$

Can color 9 edges but 10th forces red $C_{5}$ or $K_{4}$ NOT a proof
Would be a proof if this is only good coloring of $K_{12}$
There are 6 critical colorings (later)

## Questions

- When can we classify all sharpness examples for $R(G, H)=r$ ?
- What are all good colorings of $K_{r-1}$ (critical colorings)

## Questions

- When can we classify all sharpness examples for $R(G, H)=r$ ?
- What are all good colorings of $K_{r-1}$ (critical colorings)
- How many edges to the $r^{\text {th }}$ vertex must be colored before a red $G$ or blue $H$ is forced?

## A second look at our problem:

- Graph Ramsey: smallest $r$ with no good coloring
$\ldots \quad K_{r-1}, \quad K_{r}, \quad K_{r+1}, \quad \ldots$

A second look at our problem:

- Graph Ramsey: smallest $r$ with no good coloring $\ldots \quad K_{r-1}, \quad K_{r}, \quad K_{r+1}, \quad \ldots$
- Size Ramsey: smallest $s$ with no good coloring for some $F$
$\ldots \quad|E(F)|=s-1$,
$|E(F)|=s$,
$|E(F)|=s+1$,

## A second look at our problem:

- Graph Ramsey: smallest $r$ with no good coloring

$$
\ldots \quad K_{r-1}, \quad K_{r}, \quad K_{r+1}, \quad \ldots
$$

- Size Ramsey: smallest $s$ with no good coloring for some $F$ $\ldots \quad|E(F)|=s-1, \quad|E(F)|=s, \quad|E(F)|=s+1$,
- Upper and lower Ramsey for $R(G, H)=r$ :

Lower: smallest $s$ with no good coloring for some $F$ Upper: smallest $s$ with no good coloring for every $F$

$$
|E(F)|=s-1, \quad|E(F)|=s, \quad|E(F)|=s+1
$$

Restrict to $|V(F)|=r$

A second look at our problem:

- Graph Ramsey: smallest $r$ with no good coloring

$$
\ldots \quad K_{r-1}, \quad K_{r}, \quad K_{r+1},
$$

- Size Ramsey: smallest $s$ with no good coloring for some $F$ $\ldots \quad|E(F)|=s-1, \quad|E(F)|=s, \quad|E(F)|=s+1$,
- Upper and lower Ramsey for $R(G, H)=r$ :

Lower: smallest $s$ with no good coloring for some $F$ Upper: smallest $s$ with no good coloring for every $F$

$$
|E(F)|=s-1, \quad|E(F)|=s, \quad|E(F)|=s+1
$$

Restrict to $|V(F)|=r$

- Star avoiding Ramsey for $R(G, H)=r$ : smallest $r-1-t$ with no good coloring
$\ldots \quad K_{r-1} \backslash S(1, t-1), \quad K_{r-1} \backslash S(1, t) \quad K_{r-1}, \backslash S(1, t+1)$,

## Star avoiding Ramsey:

$R(G, H)=r$ add/color edges to $K_{r-1}$ one at a time: When is a red $G$ or blue $H$ forced?

## Star avoiding Ramsey:

$R(G, H)=r$ add/color edges to $K_{r-1}$ one at a time: When is a red $G$ or blue $H$ forced?

## Star avoiding Ramsey:

$R(G, H)=r$ add/color edges to $K_{r-1}$ one at a time: When is a red $G$ or blue $H$ forced?

## Star avoiding Ramsey:

$R(G, H)=r$ add/color edges to $K_{r-1}$ one at a time: When is a red $G$ or blue $H$ forced?

## Star avoiding Ramsey:

$R(G, H)=r$ add/color edges to $K_{r-1}$ one at a time: When is a red $G$ or blue $H$ forced?

## Star avoiding Ramsey:

$R(G, H)=r$ add/color edges to $K_{r-1}$ one at a time: When is a red $G$ or blue $H$ forced?

## Star avoiding Ramsey:

$R(G, H)=r$ add/color edges to $K_{r-1}$ one at a time:
When is a red $G$ or blue $H$ forced?

- Proofs: First classify sharpness examples Good colorings of $K_{r-1}$
- Examples with 'few' extra edges needed and with 'many' extra edges needed

## Example

- $R\left(K_{m}, K_{n}\right)=r$ : must add all $r-1$ edges (Chvatal 1974) even though we do not know what $r$ is
- 

$-$

## Example

- $R\left(K_{m}, K_{n}\right)=r$ : must add all $r-1$ edges (Chvatal 1974) even though we do not know what $r$ is
- make a copy of a vertex

## Example

- $R\left(K_{m}, K_{n}\right)=r$ : must add all $r-1$ edges (Chvatal 1974) even though we do not know what $r$ is
- make a copy of a vertex
- similar for $R\left(m K_{3}, m K_{3}\right)=5 m$

## Example $\left(R\left(P_{n}, P_{3}\right)=n(\right.$ Gerencser and Gyrafas 1967))

## - $R\left(P_{n}, P_{3}\right)=n$

$\bullet$
-

$K_{n-1} \backslash t K_{2}$

## Example ( $R\left(P_{n}, P_{3}\right)=n($ Gerencser and Gyrafas 1967))

- $R\left(P_{n}, P_{3}\right)=n$
- Sharpness examples: Blue graph is a matching plus isolated vertices
- 

## Example ( $R\left(P_{n}, P_{3}\right)=n($ Gerencser and Gyrafas 1967))

- $R\left(P_{n}, P_{3}\right)=n$
- Sharpness examples: Blue graph is a matching plus isolated vertices

0

$K_{n-1} \backslash t K_{2}$

- Red edge $\Rightarrow \operatorname{red} P_{n}$
- 

## Example $\left(R\left(P_{n}, P_{3}\right)=n(\right.$ Gerencser and Gyrafas 1967))

- $R\left(P_{n}, P_{3}\right)=n$
- Sharpness examples: Blue graph is a matching plus isolated vertices
- Can only add one edge to $K_{n-1}$ before a red $P_{n}$ or blue $P_{3}$ is forced.

$$
K_{n-1} \backslash t K_{2}
$$

- Red edge $\Rightarrow$ red $P_{n}$
- Two Blue edges $\Rightarrow$ blue $P_{3}$

## Example ( $R\left(P_{n}, P_{m}\right)$ (Gerencser and Gyrafas 1967))

- $R\left(P_{n}, P_{m}\right)=n+\left\lfloor\frac{m}{2}\right\rfloor-1$ for $n \geq m \geq 4$
- Sharpness examples for $n \geq m+2$. Black graph is arbitrary. Red clique can have one blue edge for odd $m$
- 3 other families when $n=m$ or $n=m+1$

## Example ( $R\left(P_{n}, P_{m}\right)$ (Gerencser and Gyrafas 1967))

- $R\left(P_{n}, P_{m}\right)=n+\left\lfloor\frac{m}{2}\right\rfloor-1$ for $n \geq m \geq 4$
- Sharpness examples for $n \geq m+2$. Black graph is arbitrary. Red clique can have one blue edge for odd $m$
- 3 other families when $n=m$ or $n=m+1$

- Red or Blue edge to red $K_{n-1}$ forces red $P_{n}$ or blue $P_{m}$
- 

## Example ( $R\left(P_{n}, P_{m}\right)$ (Gerencser and Gyrafas 1967))

- $R\left(P_{n}, P_{m}\right)=n+\left\lfloor\frac{m}{2}\right\rfloor-1$ for $n \geq m \geq 4$
- Sharpness examples for $n \geq m+2$. Black graph is arbitrary. Red clique can have one blue edge for odd $m$
- 3 other families when $n=m$ or $n=m+1$

- (only) add all red edges to $A_{\left\lfloor\frac{m}{2}\right\rfloor-1}$

## Example $\left(R\left(T_{n}, K_{m}\right)=(n-1)(m-2)+1\right.$ (Chvatal 1977))

- Unique sharpness example: Red graph is $(m-1) K_{n-1} \quad$ Blue graph is $K_{n-1, n-1, \ldots, n-1}$

## Example $\left(R\left(T_{n}, K_{m}\right)=(n-1)(m-2)+1\right.$ (Chvatal 1977))

- Unique sharpness example: Red graph is $(m-1) K_{n-1}$

Blue graph is $K_{n-1, n-1, \ldots, n-1}$

- Red edge $\Rightarrow \operatorname{red} T_{n}$

0

## Example $\left(R\left(T_{n}, K_{m}\right)=(n-1)(m-2)+1\right.$ (Chvatal 1977))

- Unique sharpness example: Red graph is $(m-1) K_{n-1}$

Blue graph is $K_{n-1, n-1, \ldots, n-1}$

- Blue edges to all parts $\Rightarrow$ blue $K_{m}$

## Example $\left(R\left(T_{n}, K_{m}\right)=(n-1)(m-2)+1\right.$ (Chvatal 1977))

- Unique sharpness example: Red graph is $(m-1) K_{n-1}$

Blue graph is $K_{n-1, n-1, \ldots, n-1}$

- (only) add all $(n-1)(m-2)$ blue edges avoiding one part

## Example ( $R\left(C_{5}, K_{4}\right)=13$ )

- Exactly 6 good colorings of $K_{12}$ (Jayawardene and Rousseau 2000)
- Ends must be different (or same) for 3 extra red edges
- Extends to $R\left(C_{n}, K_{4}\right)=3 n-2$ (but not $n=4$ )

Jonelle Hook, Garth Isaak

Star Avoiding Ramsey Numbers

## Example ( $R\left(C_{5}, K_{4}\right)=13$ )

- Exactly 6 good colorings of $K_{12}$ (Jayawardene and Rousseau 2000)
- Ends must be the same for 3 extra red edges for $n \geq 6$
- Extends to $R\left(C_{n}, K_{4}\right)=3 n-2$

Jonelle Hook, Garth Isaak

Star Avoiding Ramsey Numbers

## Summary of Results

| Ramsey number | Minimum Number of edges <br> to force bad coloring |
| :--- | :--- |
| $R\left(m K_{2}, m K_{2}\right)=3 m-1$ [L 1984] | $m$ |
| $R\left(m K_{3}, m K_{3}\right)=5 m$ [BES 1975] | $5 m$ |
| $R\left(T_{n}, K_{m}\right)=(n-1)(m-1)+1$ [C 1977] | $(n-1)(m-2)+1$ |
| $R\left(C_{n}, K_{3}\right)=2 n-1$ [FS 1974] | $n+1$ |
| $R\left(C_{n}, K_{4}\right)=3 n-2$ [SRM 1999] | $2 n$ |
| $R\left(P_{n}, P_{3}\right)=n$ [GG 1967] | 2 |
| $R\left(P_{n}, P_{4}\right)=n+1$ [GG 1967] | 2 |
| $R\left(P_{n}, P_{5}\right)=n+1$ [GG 1967] | 3 |
| $R\left(P_{n}, P_{m}\right)=n+\left[\frac{m}{2}\right]-1$ [GG 1967] <br> for all $n \geq m \geq 2$ | $\left\lvert\, \frac{m}{2}\right.$ |
